

Capstone Overview

The Capstone is the final three-week project of the AI Leadership program, designed to help participants integrate everything they have learned across all five terms. Each team selects an existing or publicly documented company and works as an “AI Transformation Advisory Team” to design a three-year strategic framework for implementing AI and Generative AI in that organization.

Over the three weeks, participants complete the following:

Week 1 – Discovery and Opportunity Sizing

Participants analyze the chosen company’s business model, challenges, industry context, and data maturity. They identify 3–5 potential AI or Generative AI use cases and complete an opportunity assessment that includes feasibility and early ROI thinking.

Week 2 – Strategy Blueprint and Financial Model

Teams define the company’s AI Vision, create a three-year roadmap, develop a scenario-based financial model (base, optimistic, conservative), outline risks and governance requirements, and describe the talent and change-management considerations needed for AI adoption.

Week 3 – Synthesis and Final Submission

All work is consolidated into a professional Board Pack, including:

- A two-page Executive Summary
- A 15–20 page Strategic Whitepaper
- A 12–15 slide Board Presentation Deck
- A one-page AI Governance Charter

The Board Pack represents their full strategic recommendation to the organization’s leadership.

Presentation Day

Teams present their strategy to the faculty panel, who act as the company's Board of Directors. Each team has 10 minutes to present, followed by 5 minutes of Q&A to defend their assumptions, decisions, and strategic recommendations.

Purpose of the Capstone

The goal is to assess whether participants can think at an executive level, apply AI strategically, build a financially grounded business case, and communicate their recommendations clearly and confidently—just as they would in a real advisory or boardroom setting.
